## Abstracts

According to our (Global Info Research) latest study, the global Intravenous Radiofrequency Closure System market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

Radiofrequency ablation closure (RFA) is a new minimally invasive technique. It is an interventional doctor who uses a special radiofrequency catheter and ultrasound interventional technology to insert the radiofrequency catheter into the great saphenous vein. The catheter radiofrequency generator generates heat energy, causing local tissue hyperthermia in the blood vessel cavity, contraction of the collagen fibers in the venous endothelium, closure of the blood vessels, and ultimately fibrosis. RFA treatment can be performed through color ultrasound-guided puncture, with only one needle hole in the wound. The varicose vein branches remaining in the lower leg are then removed through minimally invasive spot stripping, which can achieve better results for severe varicose veins.
