According to our latest research, the global Juvenile Idiopathic Arthritis Diagnostic market size will reach USD 8602 million in 2031, growing at a CAGR of 3.9% over the analysis period.

Juvenile Idiopathic Arthritis (JIA) is a type of arthritis that occurs in children under the age of 16. It is characterized by persistent joint inflammation, stiffness, and pain that lasts for at least six weeks, without any known cause. JIA is an autoimmune disorder, meaning the body's immune system mistakenly attacks its own tissues, primarily affecting joints but potentially also other organs. Diagnosing JIA involves clinical evaluation, imaging (like X-rays or MRIs), and laboratory tests (such as blood tests for inflammation markers and specific antibodies) to rule out other conditions and confirm the diagnosis.
