A Laser Speckle Blood Flow Imager is a non-invasive optical device used to visualize and measure blood flow in tissues. It operates by projecting a laser onto the tissue surface and capturing the resulting speckle pattern with a camera. The speckle pattern, created by the interference of coherent light scattered by moving red blood cells, changes over time. By analyzing these changes, the imager can provide detailed, real-time maps of blood flow dynamics across the tissue. This technology is particularly useful in medical and biological research, including monitoring blood flow in the skin, brain, and other organs, assessing wound healing, and evaluating vascular health. The high-resolution and real-time capabilities of laser speckle imaging make it a valuable tool for both clinical diagnostics and experimental research.
