The left-sided double-lumen bronchial tube, also known as the Carlen tube, is a special endotracheal tube. The left-sided double-lumen bronchial tube is a bifurcated endotracheal tube with two separate lumens, one for ventilation and one for suction, or to isolate the left lung from the right lung. This catheter is designed to be inserted into the patient's left main bronchus to support specific medical operations, such as thoracic surgery, lung surgery, or ventilation management for critically ill patients. The left double-lumen endobronchial catheter is widely used in the medical field, especially in surgeries that require single-lung isolation technology, such as pneumonectomy, lobectomy, bronchial surgery, etc. In addition, the catheter can also play an important role in the ventilation management of critically ill patients, effectively maintaining the patient's ventilation status and improving ventilation quality.

As a type of double-lumen bronchial tube, the market of the left-sided double-lumen bronchial tube is in a rapid development stage. With the aging of the global population, the number of patients with respiratory diseases continues to increase, and the demand for high-end medical devices such as left-sided double-lumen bronchial tubes continues

to grow. The demand for left-sided double-lumen bronchial tubes in medical fields such as thoracic surgery and intensive care is also expanding, especially in surgeries that require single-lung isolation technology, where its application is more extensive. In summary, the left-sided double-lumen bronchial tube market is in a rapid development stage and will continue to grow in the future.
