The leptin receptor, also known as LEP-R or OB-R, is a type I cytokine receptor, a protein encoded by the LEPR gene. The function of LEP-R is as a receptor for the adipocyte-specific hormone leptin. LEP-R has also been named CD295 (cluster of differentiation 295). Its location is the cell membrane, with extracellular, transmembrane and intracellular parts (protein domains). The hormone leptin regulates adipose tissue mass through its hypothalamic effects on hunger and energy utilization. It exerts its effects through the leptin receptor (LEP-R), a single transmembrane domain receptor in the cytokine receptor family. In hypothalamic neurons, adequate leptin receptor function and subsequent regulation of energy metabolism and body weight depends on the interaction of the receptor with gangliosides on the cell membrane.
