According to our (Global Info Research) latest study, the global Live and Dead Bacteria Staining Kit market size was valued at US\$ 390 million in 2024 and is forecast to a readjusted size of USD 578 million by 2031 with a CAGR of 5.9% during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

The bacterial staining kit is two fluorescent dyes, DMAO and EthD-III, which can stain live bacteria green and dead bacteria red, respectively. DMAO is a green nucleic acid fluorescent dye that can stain live and dead bacteria. EthD-III is a red nucleic acid fluorescent dye that only stains dead bacteria with damaged cell membranes. When DMAO and EthD-III are mixed and used for staining, bacteria with intact cell membranes appear green, while bacteria with damaged cell membranes appear green and red. The results can be analyzed by fluorescence microscopy or flow cytometry and are applicable to most bacterial types.
