According to our (Global Info Research) latest study, the global Liver-on-a-Chip Model market size was valued at US\$ 127 million in 2024 and is forecast to a readjusted size of USD 257 million by 2031 with a CAGR of 10.7% during review period.

Liver-on-a-Chip Model is to study toxicity mechanisms of preclinical drug candidates to help reduce clinical trial safety failures.

The liver chip model is an advanced biomedical model for simulating and studying the biological function and drug response of the human liver. It is the product of the combination of microfluidic chip technology and cell culture technology, which can replicate the structure and function of the liver on a tiny chip and provide a more realistic in vivo environment. The liver is one of the most important organs in the human body, with multiple functions such as detoxification, metabolism, and protein synthesis. However, traditional cell culture and animal experiments cannot fully mimic the complex functions and interactions of the liver. Therefore, the emergence of the liver-on-a-chip model has filled this technological gap. The liver chip model can simulate the three-dimensional structure and cell organization of the liver on a tiny chip, and at the same time simulate the microenvironment of the liver, such as blood flow, oxygen concentration and nutrient supply. The liver chip model can accommodate various types of liver cells, including hepatocytes, hepatic stellate cells, and liver endothelial cells, making the research closer to the real liver.
