## Abstracts

According to our (Global Info Research) latest study, the global Low-pressure Balloon Catheter market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

A low-pressure balloon catheter is a special medical catheter, usually consisting of a catheter body and an expandable balloon extending from the distal part of the catheter body. The design of this catheter allows doctors to accurately deliver it to the target area, such as a stenotic site of a blood vessel, and expand the balloon by inflating it, thereby expanding the lesion site.

The characteristic of a low-pressure balloon catheter is that it can withstand lower pressure for expansion. Compared with a high-pressure balloon, a low-pressure balloon requires less pressure when expanding, which makes it more suitable in certain specific treatment scenarios. For example, when dealing with some more fragile blood vessels or tissues, the use of a low-pressure balloon can reduce the risk of damage to surrounding tissues.

Low-pressure balloon catheters are widely used in interventional treatments. By puncturing the patient's artery or vein, doctors can use a guidewire and catheter to deliver a low-pressure balloon to the lesion site. Then, the balloon is expanded by inflating it, thereby improving the stenosis or occlusion of the blood vessel. In addition, a

low-pressure balloon catheter can also be combined with a drug balloon to deliver drugs to the lesion site to reduce or inhibit the occurrence of restenosis of the blood vessel.
