?The low range radio altimeter is an airborne radio device used to measure the vertical distance from the aircraft to the ground, with a measurement range of 0-2,500 feet. It calculates the actual height of the aircraft from the ground by transmitting FM signals and receiving signals reflected from the ground, and transmits the data to other related systems of the aircraft for display and use. ?The low-altitude radio altimeter is mainly used in the takeoff and landing phases of the aircraft, especially in low visibility and automatic landing conditions. It can provide accurate ground height information to help pilots land safely.?
