According to our (Global Info Research) latest study, the global Low Temperature SCR Catalysts market size was valued at US\$ 296 million in 2023 and is forecast to a readjusted size of USD 480 million by 2030 with a CAGR of 6.1% during review period.

Low-temperature denitrification catalyst is a highly efficient composite oxidation catalyst, which is non-toxic and has no secondary pollution. Low-temperature denitrification catalysts are critical in various industrial processes, particularly in reducing nitrogen oxides (NO_x) emissions. These catalysts enable efficient conversion of NO_x to nitrogen (N₂) at lower temperatures, making them increasingly relevant in sectors that require enhanced emissions control technology. It can catalyze in a wider and lower temperature range (room temperature to below 300°C).

The non-electric industry contains many industries. Affected by the production processes and other conditions of different industries, the flue gas conditions of each industry have different characteristics. The flue gas of coke ovens has the characteristics of low flue gas temperature (mostly between 200°C-250°C), complex flue gas composition, and large differences in flue gas NO_x content. The flue gas of steel sintering has the characteristics of low flue gas temperature and wide range of variation (generally between 120°C-180°C), large flue gas volume and uneven distribution, large variation of SO₂ concentration in flue gas, and complex flue gas composition. The "original" flue gas temperature of cement kilns is relatively high (above 300°C), but it has the characteristics of high dust content and contains a large amount of alkali and alkaline earth metals. High dust is easy to clog and wear catalysts, and alkali metals are easy to block or poison the catalyst surface, which is very unfavorable for high-temperature SCR denitrification; if the SCR denitrification reactor is arranged after the dust collector, the flue gas temperature will be reduced to below the conventional

treatment temperature zone of high-temperature catalysts. Therefore, for several major sub-industries in the non-electric industry, if high-temperature SCR denitration catalysts are used, the flue gas needs to be heated, which will greatly increase the operating costs of the enterprise. In comparison, low-temperature SCR denitration catalysts can still maintain high activity under lower temperature conditions. On the premise of ensuring that the denitration efficiency is met, it can avoid or reduce the heating of flue gas by non-electric enterprises. Therefore, the use of low-temperature SCR denitration catalysts in the non-electric industry can effectively help enterprises reduce energy consumption, save energy, and complete the emission transformation of pollutants NO_x, which has obvious competitive advantages and social and economic value.
