Lower extremity arterial disease refers to a disease in which localized stenosis or occlusion of lower extremity arteries causes ischemia of the body. Stenosis or occlusion of lower extremity arteries can cause symptoms such as intermittent claudication, cold skin in the legs or feet, chronic pain, and gangrene. The main cause of lower extremity arterial disease is atherosclerosis, and lesions related to atherosclerosis account for 90%-95% of all lesions. The 5-year mortality rate of patients with intermittent claudication is about 30%, while the 5-year mortality rate of patients with lower extremity ischemia with rest pain, ulcers, and gangrene is as high as 70%.
