Lubricant and grease used in Tunnel Boring Machines (TBMs) are essential for ensuring the smooth operation of the machine's critical components, including the drive system (motors, gearboxes, etc.), cutterhead, and bearings. These lubricants and greases reduce friction, prevent wear, and protect against corrosion in the harsh and demanding conditions of tunnel excavation.

Lubricants in TBMs are typically used in the form of oil or fluid, which help to reduce friction between moving parts and carry away heat and debris. The choice of lubricant depends on the component it is being used for and the specific operational environment.

Grease is a thicker lubricant made by combining a base oil with a thickening agent (like lithium, calcium, or aluminum soap), along with additives. Grease stays in place better than liquid lubricants and is often used for components that operate under high pressure or are exposed to harsh conditions where oil might be displaced or evaporate.
