According to our (Global Info Research) latest study, the global Magnetically Controlled Capsule Gastroscopy market size was valued at US\$ 210 million in 2023 and is forecast to a readjusted size of USD 636 million by 2030 with a CAGR of 18.2% during review period.

Magnetically Controlled Capsule Gastroscopy (MCCG) is a non-invasive technology for gastric examination that allows a comprehensive view of the stomach by swallowing a small capsule. The capsule is equipped with a camera and wireless transmission system, which is guided and precisely controlled inside the body through an external magnetic system. Compared to traditional gastroscopy, MCCG offers several advantages, including no need for anesthesia, a comfortable and painless procedure, and broad suitability for various patient groups, especially the elderly or those who fear conventional gastroscopy. It is widely used for early detection of gastric diseases such as ulcers, polyps, and gastric cancer, providing a convenient and efficient diagnostic solution.

Magnetically controlled capsule gastroscopy has garnered increasing attention in the medical field, primarily for its application in non-invasive screening and diagnosis of gastric diseases. Compared to traditional endoscopy, this technology offers a pain-free, comfortable, and convenient alternative, appealing to both patients and healthcare providers. In emerging markets like China, rising health awareness and the growing prevalence of gastrointestinal diseases have accelerated its adoption. However, challenges such as high device costs, technical complexities, and the early stage of market promotion continue to limit its penetration.

The market for magnetically controlled capsule gastroscopy is expected to grow rapidly due to ongoing technological advancements, decreasing manufacturing costs, and

increasing demand for healthcare services. The integration of artificial intelligence and advanced imaging technologies promises enhanced diagnostic accuracy. Additionally, policy support and the expansion of insurance coverage are likely to drive greater acceptance of this technology. Globally, it holds significant potential to address the unmet need for non-invasive gastric examinations in developed regions.

Key drivers of growth include improved patient experience, technological innovation, and the rising demand for non-invasive diagnostic solutions among healthcare providers. However, several barriers remain, including high R&D costs, the need for specialized training for medical personnel, and limited acceptance among some patient groups. Moreover, disparities in healthcare policies and reimbursement systems across regions pose challenges to widespread adoption.
