## Abstracts

According to our (Global Info Research) latest study, the global Marine Active Filters market size was valued at US\$ 376 million in 2025 and is forecast to a readjusted size of US\$ 571 million by 2032 with a CAGR of 6.0% during review period.

Marine active power filters (APBs) are devices used to improve the power quality of ship electrical systems, effectively suppressing harmonics, compensating for reactive power, and stabilizing voltage. Through dynamic current compensation, these systems enhance power supply stability, protect shipboard equipment, and meet classification society and relevant electrical standards. They are widely used in electric propulsion vessels, offshore platforms, and vessels with high-power electronic loads. The marine APB industry chain includes upstream power semiconductor devices, control processors, capacitors, inductors, heat dissipation systems, and structural housings; midstream systems integration, control software development, testing, and classification certification; and downstream applications covering commercial vessels, electric ships, offshore platforms, port facilities, and ship system integrators, along with supporting installation, commissioning, system parameter tuning, operation monitoring, and maintenance services. In 2025, global production of marine APBs was approximately 3,842 units, with a global average market price of approximately US\$95,000 per unit. The gross profit margin of major manufacturers in the industry ranges from 45% to 65%, primarily supported by advanced power electronics technology, control algorithms, and marine-grade reliability requirements. In 2025, the global production capacity of marine active power filters will be approximately 5,123 units, which will be able to support the continued demand brought about by the electrification trend of marine power systems.
