According to our (Global Info Research) latest study, the global Masterbatches Antimicrobial market size was valued at US\$ 1247 million in 2023 and is forecast to a readjusted size of USD 2156 million by 2030 with a CAGR of 7.9% during review period.

A masterbatch is a concentrated blend of pigments or additives that are encapsulated within a polymer carrier. It is used to introduce colour and other properties to polymers and other materials during the manufacturing process. An antimicrobial masterbatch is a type of masterbatch that contains a concentrated blend of antimicrobial material encapsulated within a polymer carrier. The antimicrobial material is used to eliminate up to 99.99% of microorganisms on the surface of a treated material. The process of creating an antimicrobial masterbatch typically involves mixing the antimicrobial material with an appropriate polymer carrier and processing the mixture using specialised equipment, such as an extruder. The resulting antimicrobial masterbatch is a concentrated blend of the antimicrobial material and the polymer carrier, which can be easily added to the base polymer during the manufacturing process. Indeed, an antimicrobial masterbatch can be used in a variety of different manufacturing processes, including injection moulding, blow moulding, and extrusion. Once added to the base polymer, the antimicrobial material is released slowly, providing ongoing protection against the growth of microorganisms on the surface of the treated material. The protection continues for the usual lifetime of the product. This is advantageous for the manufacture of a wide range of products such as packaging materials, medical products, toys, and textiles.

Additive masterbatches are commonly used in plastic manufacturing to enhance the properties of moulded components or to improve processing. In the wake of the COVID-19 pandemic, hygiene, and in particular, efficient measures to counter the

spread of harmful bacteria, remain a global priority. An antimicrobial additive masterbatch is a popular and logical choice for any brand or manufacturer seeking to inhibit the growth of harmful bacteria on the surface of their plastic mouldings.
