Abstracts

According to our (Global Info Research) latest study, the global MBE Systems market size was valued at US\$ 98 million in 2024 and is forecast to a readjusted size of USD 139 million by 2031 with a CAGR of 5.2% during review period.

The Molecular Beam Epitaxy (MBE) system is termed as an ultra-high vacuum technique for the layer-by-layer (epitaxial) deposition of thin films. The technique is exclusively used for the development of very high purity III-V semiconductors where the thickness of layers can be measured with sub-monolayer accuracy. The system contains six solid source effusion cells and 2 RF plasma gas sources. It is exclusively used in the manufacture of semiconductor devices like transistors, and known as a fundamental tool for the development of the nanotechnologies. Moreover, it is a valuable system in the development of urbane optoelectronic and electronic devices and MBE growth of semiconductor layers are essential for resonant-cavity photodetectors.

Europe is the world's largest production region of MBE systems, and exports to many countries around the world. With the development of the semiconductor and materials industry, customers have put forward more quality requirements and higher technical indicators for the molecular beam epitaxy system as their key research and production equipment, and the specifications have become more and more diversified. Enterprises of MBE systems should actively improve product quality so that their products have market appeal. The major manufacturers of MBE systems on the market include Veeco in the United States, Riber in France and DCA in Finland. There are many manufacturers of normal molecular beam epitaxy products, such as Veeco, Riber and Sienta Omicron. Manufacturers of laser MBE systems mainly include Pascal in Japan and Prevac in Poland. At present, the normal molecular beam epitaxy system occupies the main sales market, with a market share of about 74%. The laser molecular beam

epitaxy system is also widely used because it is suitable for growing thin films with multiple elements, high melting points, and complex layered structures.
