Abstracts

According to our latest research, the global Medical Device Overmolding market size will reach USD million in 2031, growing at a CAGR of %over the analysis period.

Medical device overmolding is a process that involves two materials; substrate, as the base material, and overmold molding which is molded over the substrate as the outer layer. The substrate material can be metal or polymer, whereas the overmolding material can be thermoplastic or elastomer (silicone). The basic premise of overmolding is to take economic advantage of two materials with uniquely different properties by incorporating them into a single-molded component. The medical components manufactured with the overmolding process are safe, resistant to electric shock, efficient, flexible, and functional. Overmolding is sustainable and environmentally friendly as it encourages the reduction of material waste and energy consumption.
