Medical phosphatidylcholine coating is a layer of anticoagulant material that is applied to the surface of medical devices. The key component of this coating is phosphatidylcholine. Phosphatidylcholine is a zwitterionic compound, meaning it has both a positively - charged choline group and a negatively - charged phosphate group in its molecular structure. This coating is formed on the surface of medical devices such as vascular stents, catheters, and artificial joints through physical adsorption, chemical covalent bonding, or other film - forming techniques. It serves to enhance the biocompatibility of medical devices, reduce thrombus formation, and lower protein adsorption.
