A membrane heart-lung machine, also known as a cardiopulmonary bypass (CPB) machine, is a vital medical device used during open-heart surgery to temporarily take over the functions of the heart and lungs. It uses a membrane oxygenator, which is a specialized filter that oxygenates blood by exchanging oxygen and carbon dioxide, much like the lungs do. This process allows the blood to be oxygenated and circulated through the body, ensuring that tissues and organs continue to receive oxygen while the heart is temporarily stopped for surgical procedures.
