According to our (Global Info Research) latest study, the global Metal Ore Sorting System market size was valued at US\$ 494 million in 2025 and is forecast to a readjusted size of US\$ 888 million by 2032 with a CAGR of 8.8% during review period.

Metal mineral sorting system is advanced industrial systems used in the mining industry. They employ one or more sensors to detect the physical or chemical properties of individual ore or particles on a high-speed conveyor belt, and automatically trigger separation devices based on real-time analysis. This separates valuable metal-containing ores from waste rock, improving the feed grade of concentrators. The demand for metal mineral sorting systems originates directly from the mining process, aiming to improve the grade of raw ore through pre-sorting, reduce ore transportation and processing volume, lower energy consumption and costs, and meet the stringent requirements of downstream smelting industries for controlling the grade and impurities of raw materials entering the furnace. The upstream supply chain mainly includes suppliers of ore mining equipment, sensors (such as X-ray, laser, and spectral recognition), high-pressure pneumatic/mechanical actuators, and intelligent control software; the downstream is closely connected to processing stages such as crushing, grinding, and beneficiation (such as flotation and magnetic separation), making it a key link in improving the efficiency and economic benefits of the entire mining industry chain. In 2025, the production of metal mineral sorting systems is estimated at 80,000 units, with an average selling price of approximately US\$6,000 per unit and a gross profit margin of approximately 35%.
