Metallized Film for Capacitors is a type of thin metal-coated film used in the manufacturing of capacitors. It serves as one of the key components in creating the electrical storage capacity within capacitors. This film is typically made of plastic or polymer material and coated with a thin layer of metal, such as aluminum or copper. The metallized film acts as one of the electrodes in the capacitor, along with the other electrode being the conductive surface of the capacitor. The film's ability to store charge and release it quickly makes it an essential component in electronic circuits, particularly in high-frequency applications where capacitors are needed to provide stable power supply and filter out noise.
