According to our (Global Info Research) latest study, the global MGB (Minor Groove Binder) Probes market size was valued at US\$ 331 million in 2024 and is forecast to a readjusted size of USD 533 million by 2031 with a CAGR of 7.1% during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

MGB (Minor Groove Binder) Probes are specialized molecular probes used primarily in real-time PCR (Polymerase Chain Reaction) to enhance the detection of target DNA or RNA sequences with high sensitivity and specificity. These probes incorporate a minor groove binder, a small molecule that binds tightly to the minor groove of double-stranded DNA, improving probe stability and increasing the melting temperature. This makes MGB probes particularly effective in applications requiring high accuracy, such as diagnostics and genetic research.
