Abstracts

According to our (Global Info Research) latest study, the global Micro Coreless Motor market size was valued at US\$ 880 million in 2024 and is forecast to a readjusted size of USD 1234 million by 2031 with a CAGR of 3.7% during review period.

Micro coreless motor is a compact and lightweight electric motor that does not contain a traditional iron core within its rotor assembly. Instead, it utilizes a winding structure directly wound onto a cylindrical sleeve or shaft, which is then placed within a stationary stator that contains electromagnetic coils. The absence of an iron core allows for reduced inertia and friction, enabling the motor to achieve high-speed operation with rapid acceleration and deceleration capabilities. Micro coreless motors are often used in applications requiring precise positioning, fast response times, and low power consumption, such as in medical devices, optical systems, cameras, drones, and other miniature electronic devices. Their compact size and efficient performance make them ideal for integrating into space-constrained environments while maintaining high levels of performance and reliability.
