Abstracts

According to our (Global Info Research) latest study, the global Multiorgan-on-a-Chip market size was valued at US\$ 186 million in 2024 and is forecast to a readjusted size of USD 355 million by 2031 with a CAGR of 9.8% during review period.

Multiorgan-on-a-chip (multi-OoC) devices, by supporting cross-organ communication, allow the study of multiorgan processes and modeling of systemic diseases. Multi-OoC approaches provide new insights that would be lost using single-OoC models. Multi-organ chip is an advanced biomedical technology, also known as "human organ simulation chip" or "in vitro organ chip". It is used to simulate the structure and function of multiple human organs, and realize the interaction between these organs on the chip. It is the product of the combination of microfluidic chip technology and cell culture technology, aiming to more realistically simulate the complex functions and interrelationships of human organs. Although traditional cell culture and animal experiments are helpful to study the biological characteristics of a single organ, they cannot simulate the interaction between organs and the complex physiological processes in vivo. The emergence of multi-organ chips solves this problem. It can simulate multiple organs on a tiny chip, such as liver, kidney, heart, lung, etc., while simulating blood circulation and signal communication between organs.
