According to our (Global Info Research) latest study, the global Multiphoton Microscopy market size was valued at US\$ 234 million in 2024 and is forecast to a readjusted size of USD 319 million by 2031 with a CAGR of 4.6% during review period.

Multiphoton microscopy (MPM) is an imaging technique that allows intact biological samples to be visualized at high resolution. MPM is based on nonlinear optical processes such as two-photon and three-photon excited fluorescence (2PEF, 3PEF) and second and third harmonic generation (SHG, THG) (see figure 1 below). Most commonly, 2PEF and 3PEF are used to image fluorescent dyes or endogenous molecules. SHG is used to image non-centrosymmetric structures such as collagen fibers and THG is used to visualize the refractive index differences such as the interface of lipid droplets.

Market competition is intense. Bruker, Leica, Carl Zeiss, Olympus, Nikon, etc. are the leaders of the industry, and they hold key technologies and patents, with high-end customers. Top 5 manufacturers accounted for 70% market share in 2019.
