A nasoduodenal (ND) tube is a flexible medical tube used for delivering nutrition, medication, or fluids directly into the duodenum, the first part of the small intestine. The tube is inserted through the nose, passed down the esophagus, through the stomach, and positioned in the duodenum. ND tubes are typically used for patients who cannot tolerate feeding through the stomach, such as those with gastroparesis or high aspiration risk. This method ensures that nutrients bypass the stomach and are absorbed directly in the intestines.
