Nasopharyngeal and oropharyngeal airways are devices used to maintain an open airway in patients who may have compromised respiratory function. The nasopharyngeal airway, also known as a nasal trumpet, is inserted through the nostril and extends into the nasopharynx, providing a clear passage for air and reducing the risk of airway obstruction caused by the tongue or other soft tissues. This type of airway is particularly useful in patients with reduced consciousness who still have intact gag reflexes and is preferred when oral insertion is not feasible.
