Negative pressure drainage sponge is a consumable material specially used for negative pressure drainage therapy. It is usually made of porous polyurethane or polyethylene material and has good adsorption and drainage properties. It is placed on the wound or wound surface. By connecting the negative pressure device, the accumulated fluid and pus in the wound are evenly sucked out through the sponge, thereby keeping the wound surface dry, promoting healing, and stimulating the formation of new tissue. The porous structure of the sponge helps to evenly distribute negative pressure and is suitable for the treatment of deep wounds and complex wounds.
