Non-absorbable orthopedic pins are medical devices used in orthopedic and orthopedic surgery, usually made of metal materials such as stainless steel and titanium alloy that are not easily absorbed by the human body. They are used to fix fractures, joint dislocations or other bone-related orthopedic treatments, providing long-term stable support. Unlike absorbable orthopedic pins, non-absorbable orthopedic pins are not gradually absorbed or degraded by the body, so they need to be removed in a second surgery after surgery. Their main function is to ensure that the bone remains in the correct position during the healing process until the healing is complete.
