Abstracts

According to our (Global Info Research) latest study, the global Non-Contact Passive Sensor market size was valued at US\$ 1118 million in 2023 and is forecast to a readjusted size of USD 2349 million by 2030 with a CAGR of 11.3% during review period.

A non-contact passive sensor is a sensor device that does not require direct contact with the object being measured and does not rely on an external power supply. It senses or detects the target signal by utilizing the physical or electromagnetic characteristics of the external environment (such as temperature, humidity, electric field, magnetic field, etc.) and converts it into a usable output signal. Passive sensors complete data acquisition and transmission by self-excitation or drawing energy from external signals. Therefore, they have the characteristics of being passive, low power consumption, and contactless. They are widely used in temperature monitoring, object detection, environmental monitoring and other fields.

As a traditional measuring tool, contact sensors still play an important role in many fields, especially in applications that require accurate measurement of physical quantities (such as pressure, temperature, earthquake, etc.). With the advancement of technology, contact sensors are developing towards miniaturization, high precision, and standardized direction. For example, by integrating micro sensors and advanced material technology, future contact sensors will be able to provide higher-precision measurements in a smaller space. In addition, with the combination of the Internet of Things and artificial intelligence, the application of contact sensors will not only be limited to data acquisition, but will also be combined with functions such as intelligent analysis and real-time feedback, promoting their widespread application in medical, industrial automation, intelligent manufacturing and other fields.
