According to our (Global Info Research) latest study, the global Non-Drug-Eluting Devices market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

Non-drug eluting devices perform specific functions without releasing drugs. They are used in medical procedures and treatments, focusing on physical or mechanical interventions. Implants typically need removal, while sutures dissolve naturally and do not require removal. Key properties of these devices include primarily providing structural support, being made from biocompatible materials, maintaining sterility to prevent infections, offering high durability and strength, and performing specific functions. Long-term use of drugs to treat cardiovascular diseases may cause some side effects, such as bleeding, liver and kidney damage, etc. Non-drug eluting devices can reduce the amount of drugs used to a certain extent, thereby reducing the risk of drug side effects. With the continuous advancement of medical imaging technology and interventional treatment technology, the treatment of non-drug eluting devices will be more accurate. Doctors can use high-resolution imaging equipment to accurately locate the lesion and select appropriate treatment methods and equipment to improve the treatment effect.
