A non-invasive feeding tube is a medical device used to provide nutrition without requiring surgical insertion into the body. These tubes are typically placed through the nose or mouth and lead directly to the stomach or small intestine. Non-invasive feeding tubes, such as nasogastric (NG) tubes or orogastric tubes, are often used for short-term feeding needs, particularly in patients who have temporary swallowing difficulties or are recovering from surgery. They can be easily inserted and removed, making them a convenient option for short-term nutritional support.
