Abstracts

According to our (Global Info Research) latest study, the global Non-wearable Dosimetry market size was valued at US\$ 1273 million in 2024 and is forecast to a readjusted size of USD 1782 million by 2031 with a CAGR of 5.0% during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

Non-wearable dosimetry involves the use of stationary or portable devices that are not worn on the body but are instead placed in specific locations to measure and monitor radiation levels in a given environment. These devices are commonly used in medical facilities, nuclear power plants, research laboratories, and industrial settings to assess radiation exposure in a broader area or at specific points of interest. Unlike wearable dosimeters, non-wearable dosimetry provides environmental or area-based readings, helping to ensure that radiation levels remain within safe limits for anyone present in the monitored space. These measurements are crucial for maintaining safety standards, regulatory compliance, and for conducting risk assessments in environments where radiation exposure is a concern.

This report is a detailed and comprehensive analysis for global Non-wearable Dosimetry market. Both quantitative and qualitative analyses are presented by manufacturers, by region & country, by Type and by Application.
