Abstracts

'An embedded MultiMediaCard (eMMC) is a small storage device made up of NAND flash memory and a simple storage controller. The eMMC standard for embedded flash memory applications was developed in 2006 by JEDEC and the MultiMediaCard Association.

An eMMC acts as the primary storage for portable devices like cell phones or tablets, which can augment that storage with a removable Secure Digital card or microSD multimedia card. It is the sole storage for very small sensors connected to IoT. The connection to the main board of the device is parallel, but the latest eMMC specification (version 5.1) allows for a transfer rate up to 400 megabytes per second (MBps), which is comparable to a solid-state drive using a SATA connection.'
