Abstracts

'Freeze-dried formulas use low temperatures and pressure to remove moisture. Frozen food is placed in a vacuum chamber where the temperature remains below freezing. As the pressure and temperature changes, the ice crystals (moisture) in the food are vaporized rather than evaporated. The freeze-drying process prevents the moisture in the food from becoming a liquid before it is removed. Freeze-dried foods are the closest alternative to a raw diet. These foods can be found in a formed shape like nuggets or patties, and well as flaked or granular mixes. Freeze-dried foods can be rehydrated with water before feeding, or fed directly from the package.'
