Abstracts

'Underfloor heating (UFH) is a heating system that uses embedded pipes or electric heating cables beneath a finished floor so that heat radiates steadily from floor level. It is a form of central heating using conduction, radiation and convection. Underfloor heating (UFH)'s advantages main include two aspects: it provides better quality heating without draughts or dry air, but also that, because of its low operating temperature; it can be easily linked in with alternative heating sources that output at the same low temperatures.'
