Abstracts

According to our (Global Info Research) latest study, the global Nucleating Agent 3988 market size was valued at US\$ 97 million in 2025 and is forecast to a readjusted size of US\$ 130 million by 2032 with a CAGR of 4.3% during review period.

In 2025, the global production of nucleating agent 3988 was 7,800 tons, with an average selling price of around US\$12,050 per ton. The single-line production capacity is approximately 460 tons per year, with an average gross profit margin of 20-30%. Nucleating agent 3988 is a chemical additive used in polymers to accelerate the crystallization process, improving the crystallization rate and enhancing physical properties (such as hardness, rigidity, and transparency). It is widely used in the production of thermoplastics. By optimizing the microstructure of the material, nucleating agent 3988 helps produce high-performance polymer products, performing particularly well in plastic products requiring high crystallinity.

The upstream raw materials for nucleating agent 3988 mainly include sorbitol and specific aromatic aldehydes. These basic chemical raw materials are synthesized into the core active ingredient through condensation reactions. Its downstream applications are highly concentrated in fields with stringent requirements for material toughness and heat resistance, primarily including the automotive industry (such as bumpers and interior parts), high-end pipes (such as PP-RCT hot water pipes), and heavy packaging and home appliance components requiring high impact resistance. Its core function is to improve the mechanical properties of polypropylene products to replace metals or engineering plastics.
