Abstracts

According to our (Global Info Research) latest study, the global Nylon Abrasive Wheels and Brushes market size was valued at US\$ 122 million in 2024 and is forecast to a readjusted size of USD 150 million by 2031 with a CAGR of 3.0% during review period.

An abrasive nylon brush has an abrasive grain exposed on the entire brush filament surface, so abrasive action can occur on both the tips and sides of the nylon filament. These abrasive brushes are ideal for light deburring and finishing irregular profiles and surfaces.

Abrasive nylon brushes are tools used for surface preparation and cleaning, they combine nylon material and abrasive grains, and are used to remove dirt, oxide layers, paint layers, etc. from the surface of materials, as well as for polishing and finishing work. These brushes and abrasive wheels are commonly used in the industrial, manufacturing and maintenance fields. These brushes and abrasive wheels can be used for many different tasks such as cleaning, polishing, deburring, removing paint and more. They are suitable for a variety of materials such as metal, plastic, wood and more. The base material for brushes and abrasive wheels is usually nylon, which has sufficient strength and abrasion resistance without causing damage to the surface being treated. The surfaces of brushes and grinding wheels are embedded with abrasive particles that effectively remove dirt or oxide layers from the surface during use. The types and sizes of abrasive particles vary according to different application requirements. Since brushes and grinding wheels generally do not contain metal, they are usually non-ferromagnetic, which is necessary in some special applications, such as the handling of magnetic materials.
