Optical Window and Wedge are commonly used components in optical systems with unique optical properties, which are used to control and adjust the propagation direction, intensity or frequency of light. Optical windows are usually transparent flat materials that allow light to pass through while blocking interference from the external environment, such as dust, moisture or other substances. They are widely used in laser equipment, telescopes, microscopes, spectrometers and other fields to protect optical components and keep the optical path clear. Common optical window materials include glass, plastic, quartz and sapphire, etc., and their selection depends on the wavelength of light, environmental conditions and equipment requirements.
