According to our (Global Info Research) latest study, the global Organic Chemical Foaming Agent market size was valued at US\$ 476 million in 2024 and is forecast to a readjusted size of USD 647 million by 2031 with a CAGR of 4.5% during review period.

An organic chemical foaming agent is a type of chemical compound that, when subjected to certain conditions such as heat or chemical reactions, decomposes to release gases like nitrogen and carbon dioxide, thereby creating a porous structure in polymers or other materials. Organic chemical foaming agents mainly include azo compounds, sulfonyl hydrazide compounds, and nitroso compounds. For example, azodicarbonamide (AC), a widely used azo compound, can adjust its decomposition temperature within the range of 150 - 205°C by using a foaming accelerator. These agents have good dispersibility in resins, a narrow decomposition temperature range, and the gases they produce are not easy to escape from the pores, which makes them play an important role in the production of foamed plastics, rubber and other materials.
