The oropharyngeal ventilation tube is a medical device used in emergency, anesthesia and intensive care. It is inserted into the patient's mouth and pharynx to keep the airway open and prevent airway obstruction caused by tongue retraction. Its design is usually anatomically consistent with the structure, with soft curves to comfortably fit the mouth and throat while avoiding tissue damage. The tube can ensure effective ventilation and oxygen supply when the patient loses the ability to breathe independently or is at risk of airway obstruction.
