Orthopedic bioinductive implants are advanced medical devices designed to promote the healing and regeneration of soft tissues, such as tendons and ligaments, in orthopedic applications. These implants are typically made from bioinductive materials that stimulate the body's natural healing response by encouraging new tissue growth at the injury site. The implant gradually integrates with the body and can be absorbed over time, leaving behind regenerated, healthy tissue. Commonly used in procedures like rotator cuff repair and tendon injuries, orthopedic bioinductive implants aim to reduce recovery time, improve long-term outcomes, and decrease the likelihood of re-injury by strengthening weakened or damaged tissue. They represent a significant innovation in tissue healing technology in sports medicine and orthopedic surgery.
