According to our (Global Info Research) latest study, the global Passive Seismic Monitoring Service market size was valued at US\$ 337 million in 2025 and is forecast to a readjusted size of US\$ 470 million by 2032 with a CAGR of 4.8% during review period.

Passive Seismic Monitoring Service is a specialized geophysical and engineering service that systematically records, processes, and interprets naturally occurring or human-induced seismic waves without actively generating artificial seismic sources, enabling real-time or retrospective characterization of subsurface activity, stress changes, and geological structures. This service deploys networks of highly sensitive seismic sensors—including surface seismometers, downhole geophones, and fiber-optic distributed acoustic sensing (DAS) systems—to capture low-magnitude microseismic events (typically magnitude -2 to 3) and larger natural earthquakes, then leverages advanced data acquisition platforms and AI-driven analytical tools to locate event hypocenters, calculate seismic wave velocities, determine focal mechanisms, and map subsurface fracture propagation or stress redistribution.
