## Abstracts

According to our latest research, the global Payment Card Skimming market size will reach USD 6361 million in 2031, growing at a CAGR of 9.7% over the analysis period.

Payment card skimming is a form of financial fraud where criminals illicitly obtain sensitive information from the magnetic stripe of credit, debit, or other payment cards. Perpetrators use discreet devices, known as skimmers, which are often inconspicuously attached to legitimate card readers like ATMs or gas pumps. These skimming devices covertly record the data embedded in the card's magnetic stripe, including the card number, expiration date, and sometimes the cardholder's name. Once collected, this stolen information is exploited to create counterfeit cards or conduct unauthorized transactions, leading to financial losses for the cardholder.

Payment card skimming poses a significant threat to individuals and businesses engaged in electronic transactions, and combating it requires a combination of technological advancements, public awareness, and regulatory measures to enhance the security of payment systems and protect against the unauthorized access and misuse of sensitive card data. Regular vigilance by consumers and the implementation of security measures by financial institutions and businesses are essential to mitigating the risks associated with payment card skimming.
