## Abstracts

According to our (Global Info Research) latest study, the global PCR Cloning and Subcloning Services market size was valued at US\$ 472 million in 2024 and is forecast to a readjusted size of USD 684 million by 2031 with a CAGR of 5.5% during review period.

PCR cloning and subcloning services are specialized molecular biology offerings. PCR cloning uses the polymerase chain reaction to amplify a specific DNA fragment, which is then inserted into a vector, with methods like TA - cloning, restriction - enzyme - mediated cloning, or Gibson assembly. This enables the creation of recombinant DNA molecules for applications such as gene expression studies, protein production, and gene discovery. Subcloning, on the other hand, involves transferring a pre - cloned DNA fragment from one vector to another, often to optimize gene expression, modify the genetic context, or prepare the DNA for different experimental uses like protein - protein interaction studies or viral vector production. Together, these services provide researchers and biotech industries with the means to precisely manipulate DNA for a wide range of scientific and commercial purposes.
