## Abstracts

According to our (Global Info Research) latest study, the global PCR Cloning Service market size was valued at US\$ 109 million in 2024 and is forecast to a readjusted size of USD 155 million by 2031 with a CAGR of 5.1% during review period.

A PCR Cloning Service is a specialized offering in molecular biology that leverages the Polymerase Chain Reaction (PCR) technique to isolate and insert a specific DNA fragment into a vector. The service begins with the design and synthesis of primers tailored to flank the target DNA sequence. PCR is then employed to amplify this fragment exponentially from a DNA source, which could be genomic DNA, cDNA, or a plasmid. After amplification, the PCR product is prepared for cloning. This may involve adding features like restriction enzyme sites (using primer - mediated addition) or exploiting the natural overhangs of PCR products (such as in TA - cloning). The amplified DNA is subsequently ligated into a suitable vector, and the recombinant vector is introduced into host cells (usually bacteria) through transformation. This service is tailored to the needs of researchers, biotech companies, and pharmaceutical firms, enabling them to generate recombinant DNA constructs for applications like gene expression studies, protein production, and gene - based therapy development.
