The periapical X-ray unit is a specialized X-ray imaging device used in the field of dentistry. It is primarily utilized to capture X-ray images of the apical region of teeth, assisting dentists in clearly observing the structure and pathological conditions of the periapical tissues (including cementum, periodontal ligament, and alveolar bone, etc.), such as apical periodontitis, apical cysts, and tooth root fractures. In contrast to large X-ray machines, periapical X-ray units are mainly used for localized dental imaging, with a focus on affected teeth or areas intended for implant placement. Typically, the imaging range encompasses 1-3 teeth, producing small-sized images.
