## Abstracts

According to our (Global Info Research) latest study, the global Periodic Acid Crystal market size was valued at US\$ 177 million in 2025 and is forecast to a readjusted size of US\$ 303 million by 2032 with a CAGR of 8.0% during review period.

In 2025, sales of periodic acid crystals reached 1,522 tons, with an average price of US\$113.19/kg.

Periodic acid crystals typically refer to colorless monoclinic crystals of periodic acid (H<sub>2</sub>IO<sub>6</sub>). They are strong oxidizing agents, hygroscopic, and decompose at 130–140 °C into iodine pentoxide, water, and oxygen. Contact with metal powder can be explosive. They are mainly used for PAS staining of glycoproteins, oxidative cleavage of vicinal diols, and organic synthesis.

Industrial preparation uses iodine (99.5%) and concentrated perchloric acid as raw materials, and produces H<sub>2</sub>IO<sub>6</sub> crystals in two steps: 'iodine-perchloric acid oxidation-low temperature crystallization' or 'sodium iodate electrolytic oxidation-acidification crystallization'. Iodine accounts for approximately 60% of the raw material cost (the price of iodine fluctuates between 220,000 and 280,000 RMB per ton, directly determining the cost), while perchloric acid, liquid chlorine, and energy consumption each account for 10-12%. The remainder is for labor, waste treatment, and explosion-proof packaging.
