According to our (Global Info Research) latest study, the global Periodontal Guided Tissue Regeneration Membranes market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

Periodontal Guided Tissue Regeneration (GTR) membrane is a specialized barrier used in dental and periodontal procedures to promote the regeneration of bone and tissue in areas affected by periodontal disease or trauma. The membrane is placed between the gum tissue and the bone to prevent the fast-growing gum tissue from invading the space where bone and connective tissue need to regenerate. This allows slower-growing cells from the bone and periodontal ligament to repopulate the area, facilitating the restoration of lost bone and supporting structures around the teeth. GTR membranes can be made from resorbable materials (which naturally dissolve over time) or non-resorbable materials (which require removal after healing). Their use improves the outcomes of periodontal surgeries by encouraging natural tissue regeneration and enhancing the stability of the teeth.
