Peripheral Vascular Imaging Catheters are used in the medical field for the diagnosis and treatment of peripheral vascular disease. Their design and function allow doctors to gain a clearer understanding of the structure and condition of a patient's peripheral blood vessels, allowing them to develop more precise treatment plans. Specifically, Peripheral Vascular Imaging Catheters often incorporate advanced imaging technologies such as intravascular ultrasound (IVUS), optical coherence tomography (OCT), or angiography. Through these technologies, doctors can observe the condition of blood vessel walls in real time, assess vessel stenosis, plaque formation, or other abnormal lesions, and evaluate the effectiveness of treatment.
